

PRODUCT OVERVIEW

AI Interview Portal

A complete, self-hosted technical interviewing platform — scheduling, candidate proctoring, and AI-powered evaluation in one product.

Role-based admin & candidate portal

LLM-scored answers, zero manual grading

Built-in recording & tab-switch proctoring

Automatic candidate email invites

EXECUTIVE SUMMARY

One platform, start to finish

The AI Interview Portal replaces spreadsheets, shared docs, and manual grading with a single flow: admins schedule interviews from a curated question bank, candidates answer in a guided, proctored browser session, and every answer is scored automatically by an LLM the moment it's submitted — with the recording, transcript, and structured feedback all in one place for the reviewer.

1

Admin schedules

Pick a candidate, assign questions from the bank, set a due date.

2

Candidate is notified

An email with the portal link and login credentials goes out instantly.

3

Candidate answers

Guided flow with voice dictation; session is recorded and proctored.

4

AI scores instantly

Each answer is graded and given feedback on submission — no wait.

5

Admin reviews

Score, feedback, and full recording appear together for the reviewer.

The pages that follow walk through each part of the product with live screenshots from the running application.

ACCESS & ROLES

One login, two tailored experiences

- Single sign-in screen for everyone — the portal routes each user to the right experience automatically.
- **Admins** land in a full operations dashboard: scheduling, question bank, analytics, and user management.
- **Candidates** land in a focused "My Interviews" view showing only what's assigned to them.
- Lightweight credential model today, ready to extend to SSO / SAML for enterprise rollouts.

INTERVIEW SCHEDULING

Schedule an interview in seconds

- Pick any candidate already in the system from a dropdown.
- Assign any combination of questions from the shared bank — mix topics and difficulty freely.
- Optional due date and a custom interview title (e.g. "Backend Engineer — Round 1").
- One click schedules the session **and** triggers the candidate's invite email automatically — no separate step.

The screenshot shows the 'Admin Dashboard' with a sidebar containing 'Interviews', 'Questions', 'Analytics', 'Users', and 'Settings'. The main content area is titled 'Scheduled Interviews' and features a 'Close' button. The form includes a 'Candidate *' dropdown menu, a 'Due Date (optional)' field with a date picker, an 'Interview Title' text field, and an 'Assign Questions * (0 selected)' section. This section contains three question cards, each with a 'Security' tag and a 'MEDIUM' difficulty level. The questions are: 'What is security by design and why is it important?', 'Explain man-in-the-middle attacks and how to prevent them.', and 'What is a security token (JWT) and what are its components?'.

AUTOMATED NOTIFICATIONS

Candidates are notified the moment they're scheduled

- As soon as an admin schedules an interview, the candidate receives an email automatically — no manual follow-up.
- The email includes the portal link, their login credentials, the interview title, and the due date.
- Delivered over standard SMTP — works with Gmail, a corporate mail relay, or any transactional email provider.
- Delivery failures never block scheduling — the interview is created regardless, and failures are logged for follow-up.

Username: alex.candidate@example.com

Password:

QUESTION BANK

A large, organized, fully editable question bank

- 135 questions ready out of the box, spanning JavaScript, React, System Design, Database, Backend, Cloud, and Security.
- Every question is tagged by topic and difficulty (Easy / Medium / Hard) for quick filtering when scheduling.
- Add, edit, or deactivate questions at any time — deactivated questions stay out of new interviews without deleting history.
- Bring your own question set — the bank is just data, easy to extend for any role or tech stack.

CANDIDATE EXPERIENCE

A calm, guided interview flow — with voice dictation

- One question at a time, with a clear progress bar and running timer.
- "Speak Answer" turns on real-time speech-to-text dictation — candidates can talk through an answer instead of typing.
- Runs entirely in the browser; no app install for the candidate.
- Answers autosave per question, so candidates can move back and forth without losing work.

INTEGRITY & PROCTORING

Recording and tab-switch detection, built in

- Camera and microphone recording starts automatically the moment the candidate opens their interview — no setup required.
- If the candidate switches tabs or windows, they're warned immediately and the event is counted and flagged.
- The recording is never shown to the candidate — it's attached to the session for the admin only, alongside the transcript and AI score.
- Gives reviewers confidence in remote interviews without live human proctoring.

THE CORE DIFFERENTIATOR

Every answer is scored by AI, instantly

- The moment a candidate submits an answer, it's sent to an LLM for evaluation — no waiting for a human reviewer.
- Feedback is structured across technical correctness, completeness, best practices, and communication clarity.
- An aggregate score and combined feedback summary is computed automatically when the full interview is submitted.
- Runs against a self-hosted model (Ollama) — transcript and answer data never has to leave your infrastructure.
- Scores and feedback are visible to admins only; candidates just see a submission confirmation.

REPORTING

Analytics without a BI tool

- Live breakdown of the question bank by topic and by difficulty.
- At-a-glance interview funnel: total scheduled vs. completed.
- No exports, no dashboards to configure — it's ready the moment there's data.

ADMINISTRATION

Manage every account from one screen

- Create admin or candidate accounts instantly, with credentials issued on the spot.
- Activate or deactivate accounts without deleting their interview history.
- Role is enforced end-to-end — candidates can never see another candidate's data or any score.

CANDIDATE TRUST

A respectful close to the candidate experience

- Candidates get a clear, reassuring confirmation the moment they submit.
- Scores are never shown directly to candidates — avoiding disputes over an automated number.
- Admins decide when and how to share feedback, on their own terms.

Built to be self-hosted and data-private

Frontend

React + TypeScript admin & candidate portal, running entirely in the browser — no install for candidates or admins.

Core API

Spring Boot backend handling users, questions, interviews, and evaluations, backed by a durable relational database.

AI Evaluation Service

Dedicated Spring AI microservice that scores every answer against a locally hosted LLM (Ollama) — no candidate data sent to a third-party API.

Deployment

Runs fully on your own infrastructure. The database and LLM are swappable — start local, scale to a managed Postgres and GPU-hosted model with no application changes.

See it live

The fastest way to evaluate this is a 15-minute walkthrough with your own sample questions and a real candidate account.
